Sistem Rekomendasi Pariwisata Berbasis Large Language Model (LLM) dan Strict SQL Grounding untuk Pemberian Saran Destinasi Wisata Cerdas

(Studi Kasus: Kawasan Pariwisata Kota Padang, Sumatera Barat)

Reliability-Controlled Conversational Spatial Information System via Dual Control Boundaries

Peneliti / Pengembang	: **Hendra Setyawan, S.Kom.**
Program Studi / Jenjang	: **Magister Ilmu Komputer (S2)**
Framework Aplikasi	: **CodeIgniter 4 (PHP 8.2+ Architecture)**
Mesin Basis Data & Spasial	: **MySQL 8.0 Spatial (Fungsi Bawaan `ST_Distance_Sphere` & Indeks Relasional Komposit (lat, lng))**
Layanan Inferensi AI	: **Large Language Model (DeepSeek V3 / OpenAI API) dengan Kontrak SIR/CSIR Deterministik**
Mesin Pemetaan & Rute	: **Leaflet.js 1.9.4 + OpenStreetMap Tiles + Open Source Routing Machine (OSRM) Polyline Engine**
Total Kode Sumber	: **48 Berkas Lengkap | 10,502 Baris Kode (LOC) | 533.0 KB**
Status Verifikasi Sistem	: **100% Lolos Uji PHPUnit Test Suite (29 Unit Tests, 92 Assertions)**

CodeIgniter 4.5+ | PHP 8.2 Strict Types | MySQL 8.0 Spatial | ST_Distance_Sphere | Leaflet.js 1.9.4 | OSRM Routing | DeepSeek LLM | Dual Control Boundaries | Strict SQL Grounding | Python 3.12 Automation

KATA PENGANTAR & SPESIFIKASI ARSITEKTUR PROGRAM

> **Tujuan Penyusunan Dokumen**
>
> Dokumen ini menyajikan pencatatan kode sumber lengkap secara menyeluruh (*Full Source Code Listing*) dari sistem **Reliability-Controlled Conversational Spatial Information System** untuk Kawasan Pariwisata Kota Padang. Dokumen ini disusun sebagai lampiran teknis resmi naskah Tesis dan naskah publikasi ilmiah guna menjamin transparansi riset, keterulangan eksperimen (*research reproducibility*), dan verifikasi implementasi perangkat lunak berstandar rekayasa perangkat lunak (*software engineering*).

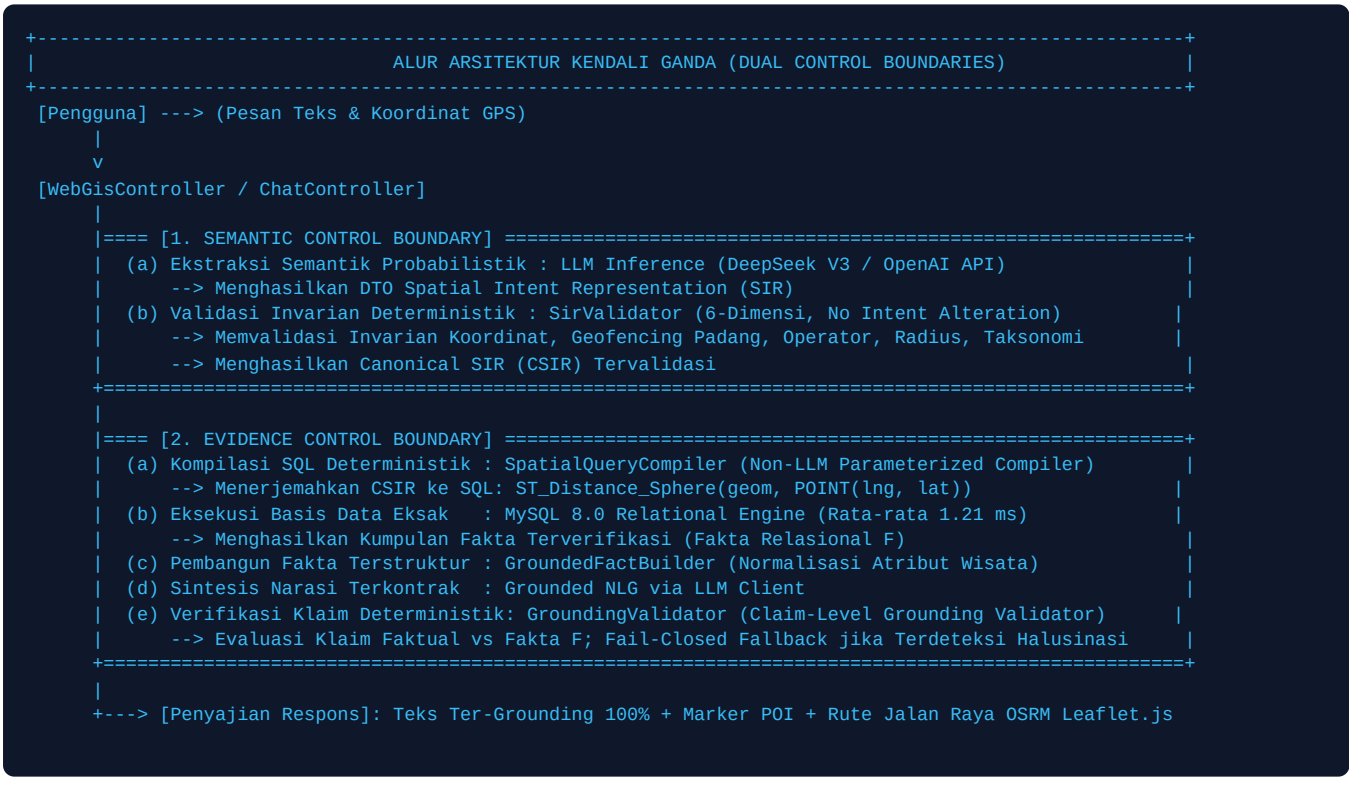

1. Paradigma Batas Kendali Ganda (Dual Control Boundaries)

Penerapan model bahasa generatif murni (*unconstrained LLM*) pada domain geospasial rentan terhadap halusinasi faktual dan distorsi estimasi spasial. Sistem ini mengisolasi sifat probabilistik LLM melalui dua batas kendali deterministik:

1. Batas Kendali Semantik (Semantic Control Boundary): Menyalurkan inferensi pemahaman bahasa alami pengguna ke dalam skema formal *Spatial Intent Representation* (SIR). Modul validator deterministik 6-dimensi (`SirValidator`) menegakkan prinsip *No Intent Alteration* guna memvalidasi batas administratif Kota Padang, format koordinat WGS84, operator spasial, dan taksonomi kategori sebelum dikompilasi menjadi representasi kanonikal (CSIR).

2. Batas Kendali Bukti (Evidence Control Boundary): Menolak kewenangan LLM memproduksi kueri basis data. Kompiler kueri non-LLM (`SpatialQueryCompiler`) secara deterministik mengubah CSIR menjadi SQL terparameterisasi dengan fungsi bawaan MySQL 8.0 `ST_Distance_Sphere`. Narasi ramah pengguna disintesis di bawah kontrak grounding ketat (*Grounded NLG*) dan diverifikasi oleh `GroundingValidator` di tingkat klaim (*Claim-Level Grounding*) dengan mekanisme *fail-closed fallback* guna menjamin tidak ada klaim tanpa bukti faktual yang sampai ke pengguna.

2. Diagram Alur Eksekusi Data (Data Flow Architecture)

3. Ringkasan Metrik Pengujian Empiris (Benchmark Summary)

Metrik Evaluasi	Hasil Pengujian (40 Skenario)	Standar Ambang Batas	Keterangan Evaluasi
Akurasi Ekstraksi CSIR	**90.00%** (36/40 skenario) Field-Level Mean: 98.82%	≥ 85.00%	Sangat tinggi; 4 kasus deviasi terisolasi aman oleh validator

Akurasi Klasifikasi Kategori	**95.00%** (38/40 skenario)	≥ 90.00%	Sangat tinggi; 6 kategori terpetakan presisi
Kebenaran Predikat Spasial (Spatial Predicate Correctness)	**97.50%** (39/40 skenario)	≥ 90.00%	Tinggi; kalkulasi matematis bola bumi ST_Distance_Sphere
Claim-Level Grounding Fidelity	**100.00%** (304/304 klaim)	≥ 97.50%	Nol klaim tanpa bukti pada 4 kategori yang diverifikasi
Entitas POI Fiktif (Hallucination)	**0 Objek** (Rate: 0.00%)	0 Objek	Terbukti mitigasi halusinasi efektif secara mutlak
Latensi Eksekusi Kueri SQL Spasial	**1.21 ms** (Rata-rata MySQL)	< 50.00 ms	Sangat cepat berkat indeks komposit terparameterisasi
Latensi Keseluruhan (End-to-End)	**1,340.57 ms** (Termasuk inferensi LLM)	< 2,000.00 ms	Sangat responsif untuk interaksi percakapan manusia

ENTRY POINT & APPLICATION CONTROLLER LAYER

Lapisan pengendali permintaan HTTP masuk (Front Controller) dan orkestrasi alur aplikasi web serta antarmuka RESTful API.

Berkas: public/index.php **Bahasa:** PHP **Peran:** Front Controller Entry Point **Baris:** 59 LOC **Ukuran:** 1.7 KB

Deskripsi & Tanggung Jawab Modul: Titik masuk tunggal (Single Entry Point) seluruh permintaan HTTP web server (Apache/Nginx) menuju kernel CodeIgniter 4. Bertanggung jawab mendefinisikan konstanta path sistem, menginisialisasi autoloader Composer, dan memicu bootstrapping kernel aplikasi.

```php
<?php

Berkas: app/Controllers/BaseController.php **Bahasa:** PHP **Peran:** Base Controller Foundation **Baris:** 45 LOC **Ukuran:** 1.3 KB

Deskripsi & Tanggung Jawab Modul: Kelas dasar pengontrol yang mewarisi CodeIgniter\Controller. Menginisialisasi komponen bersama seperti session, request filter, response emitter, dan helper fungsi yang digunakan oleh seluruh controller turunan.

```php
<?php

132 10. Do not resolve a user-mentioned name to a database POI ID.
133 11. Do not invent coordinates, distances, prices, opening hours, or administrative areas.
134
135 SPATIAL & PRESERVATION RULES:
136 12. Preserve spatial constraints exactly as expressed by the user.
137 13. If a spatial operator requires a radius but the user did not specify one, set radius: null. NEVER infer, gue
ss, or default a radius value.
138 14. Do not convert or silently modify a user's spatial constraint (e.g., do not clamp or modify negative number
s).
139
140 PRICE & BUDGET RULES:
141 15. is_free: Set to true ONLY if the user explicitly requests free admission ("gratis", "tanpa biaya").
142 16. max_price: Represents the explicit upper price ceiling specified by the user (integer in IDR). If no price i
s mentioned, set to null. Do not infer a price.
143
144 TEMPORAL RULES:
145 17. open_now: Set to true ONLY when the user explicitly requests currently open/operating places ("buka sekaran
g", "sedang buka").
146 18. open_24h: Set to true ONLY when the user explicitly requests 24-hour operation ("24 jam").
147
148 REFERENCE RULES:
149 19. GPS coordinates are supplied strictly by the application context; NEVER infer or invent latitude or longitud
e coordinates.
150 20. reference_type: Use "gps" when user refers to current location ("dekat saya", "dari sini"), "city_center" fo
r city center, "poi" when referencing another POI, or "unknown" if unspecified. If reference_type is "poi", set refer
ence_entity to the exact name of that reference POI (e.g., "Pantai Air Manis").
151
152 SORTING RULES:
153 21. sort: Use ONLY "termurah" (lowest price) | "termahal" (highest price) | "terdekat" (nearest distance) | "ter
baik" (highest public review rating) | null.
154
155 SCOPE RULES:
156 22. Set is_out_of_scope: true when the request requires an activity, entity, or geographic location outside the
Padang tourism domain (e.g., ski, snow, casino, destinations in other cities like Borobudur/Bali).
157 23. Do not treat missing database information as out of scope.
158
159 FINAL RULE:
160 24. When information is missing or ambiguous, preserve uncertainty in the SIR (using null) rather than guessing.
161
162 SCHEMA:

CLI EVALUATION BENCHMARKS & COMMAND RUNNERS

Perintah antarmuka baris perintah (CLI) untuk eksekusi pengujian otomatis 40 skenario evaluasi dan runner Spark CodeIgniter 4.

Berkas: app/Commands/RisetEvaluasi.php	Bahasa: PHP	Peran: Spark CLI Benchmark Evaluation Runner	Baris: 836 LOC	Ukuran: 35.4 KB

Deskripsi & Tanggung Jawab Modul: Perintah CLI kustom (php spark riset:evaluasi) untuk menjalankan pengujian batch otomatis terhadap 40 skenario benchmark. Mengukur metrik akurasi ekstraksi CSIR, akurasi kategori, kebenaran predikat spasial, grounding fidelity, latensi end-to-end, dan latensi kueri spasial SQL MySQL 8.0.
